KALNET Full Stack Task

Daily Learning Streak Tracker

Project Overview

Students often lose consistency in studying. A **learning streak system** motivates students to maintain daily learning habits.

Your task is to build a **Daily Learning Streak Tracker** where a student can mark that they studied today and the system tracks their streak.

This simple system demonstrates the core skills required in full stack development.

Objective

Build a web application where a student can:

- Mark “I Studied Today”
- See their current study streak
- See total days studied
- View history of study dates

The application must be **fully functional and deployed on Vercel**.

Technology Stack (Mandatory)

Frontend and Backend must both use **Next.js**.

Required stack:

- Next.js (App Router)

- TypeScript
- Tailwind CSS
- API Routes for backend
- Local storage or simple database (your choice)
- Vercel deployment

Core Features

The application must include the following features.

---

1. Home Page (Dashboard)

Display the following information:

- Welcome message
- Current streak count
- Total study days
- Last study date
- Button: **“I Studied Today”**

Example display:

Current Streak: 4 days
Total Study Days: 10
Last Studied: 11 March 2026

---

2. Study Button

When the user clicks **“I Studied Today”**:

The system should:

- Record today's date
- Update the streak if applicable
- Prevent duplicate entries for the same day

Example rule:

If user already marked today → show message
"You have already marked today."

---

3. Streak Logic

The streak must follow these rules:

If student studied:

Today → streak continues

If student missed a day → streak resets to 1

Example:

10 March → Studied
11 March → Studied
12 March → Studied

Streak = 3

If student misses 13 March and studies on 14 March

Streak resets to = 1

---

4. Study History Page

Create a simple page showing:

List of all study dates.

Example:

Study History

14 March 2026
12 March 2026
11 March 2026
10 March 2026

Newest entries should appear first.

API Requirements

Create API routes inside Next.js.

Suggested endpoints:

POST /api/study
Mark today's study.

GET /api/streak
Returns:

- current streak
- total days studied
- last study date

GET /api/history
Returns list of study dates.

Data Storage Options

Interns may choose one of these:

Option 1 (Simplest):

Local JSON file or in-memory storage.

Option 2 (Better):

Use SQLite or Prisma.

Option 3 (Very beginner):

Use browser localStorage.

The goal is **functionality**, not complex database design.

UI Requirements

The UI should be simple but clean.

Required elements:

- Dashboard card
- Study button
- History list
- Success/error messages

Use Tailwind for styling.

Example components:

- Stats card
- Button
- Study history list

Project Folder Structure

Example structure:

```
app
 ├ dashboard
 ├ history
 ├ api
 │   ├ study
 │   ├ streak
 │   ├ history

components
 ├ StreakCard
 ├ StudyButton
 ├ HistoryList

lib
 ├ streakLogic
```

Business Rules

The system must enforce the following:

1. Users cannot mark study twice in one day.
2. Streak increases only if the previous day was also studied.
3. If a day is skipped, streak resets.
4. Study history must store all study dates.

Deployment Requirement

The project must be deployed on **Vercel**.

Steps interns must complete:

1. Push code to GitHub
2. Connect repository to Vercel
3. Deploy application
4. Share live link

Example final output:

https://your-project.vercel.app

Deliverables

Intern must submit:

1. GitHub repository
2. Vercel live link
3. README file including:

Project description
Setup instructions
How streak logic works

Final Instruction

Focus on making the application:

- Clean
- Working
- Deployed
- Easy to understand

The goal is not complexity, but demonstrating **full stack fundamentals**.
